Courses

Tropical Medicine (TRMD)

TRMD 6010  Biol Basis of Disease  (3)
This course provides a foundation of knowledge about the human body in health and disease. It gives an overview of important concepts of the biological mechanisms of disease at the cellular, individual, and societal levels. At the cellular level, the course summarized DNA and cellular function, genomics, immunology, and vaccination. At the individual and societal levels, the course addresses the most important infectious and non-infectious causes of death worldwide, providing background on their pathophysiology, clinical aspects, and patterns of disease occurrence, risk factors, and methods of prevention.

TRMD 6050  Medical Helminthology  (2)
This course covers the parasitic worms with special reference to those causing disease in humans. In lecture, the student becomes acquainted with the different taxonomic groups of helminths, their phylogenetic and zoological relationships, morphological and structural characteristics, geographical distributions, methods of transmission, vectors, reservoir hosts, pathology including location and tissue damage in the human body and including aspects of the molecular pathogenesis, anthelmintic chemotherapy including modes of action of anti-parasitic medications, parasitological diagnosis of helminth infections, aspects of the immunology of helminth infections, methods of helminth parasite control and other public health implications, and other tropical issues.

TRMD 6060  Medical Entomology  (3)
This course is designed to provide the fundamental information necessary for understanding and evaluating both the role of arthropods in transmission of pathogens causing human disease, and the role of arthropods in directly causing human disease. Following a brief overview of the general anatomy, physiology, and classification of arthropods, individual groups of medical importance are considered in detail with regard to the recognition of important species, the epidemiology and pathogenesis of associated diseases, and the principles and methods of vector control.

TRMD 6070  Medical Protozoology  (2)
The basic biology of protozoa capable of infecting humans as well as the clinical manifestations of the diseases they cause will be covered. This is a comprehensive course covering all aspects of medically important protozoa and the diseases they cause. Topics covered will include life cycles, morphological features, host-parasite interactions, geographical distribution, reservoir hosts, methods of transmission and control, pathology, clinical features, and immunological aspects. The biological and clinical perspectives gained in this course will assist students in the practical recognition, evaluation, and management of problems in public health or clinical practice involving protozoa that infect humans.

TRMD 6080  Medical Protozoology Lab  (1)
The identification of medically important parasites relies heavily upon macroscopic and microscopic examination of clinical specimens. In this course students will learn the basic principles of identifying parasitic helminthes and protozoa in blood, feces, and tissue specimens. Prepared specimens of the major helminth and protozoan pathogens of humans will be provided for macroscopic and microscopic examination. Students will learn the basic operations of the microscope and how to identify and distinguish the various helminthes and protozoa. Samples demonstrating the pathological features of the disease will also be provided. The techniques for preparing diagnostic specimens of parasites in blood and feces will be reviewed.
TRMD 6090 Parasitology Laboratory (1)
The identification of medically important parasites relies heavily upon macroscopic and microscopic examination of clinical specimens. In this course students will learn the basic principles of identifying parasitic helminthes and protozoa in blood, feces, and tissue specimens. Prepared specimens of the major helminth and protozoan pathogens of humans will be provided for macroscopic and microscopic examination. Students will learn the basic operations of the microscope and how to identify and distinguish the various helminthes and protozoa. Samples demonstrating the pathological features of the disease will also be provided. The techniques for preparing diagnostic specimens of parasites in blood and feces will be reviewed.

TRMD 6100 Health and Human Rights (1)
This course is designed to provide a forum for discussion of pertinent issues in global health and human rights and to motivate students to become active advocates for their resolution. Students will participate in weekly discussions with local and national experts in public health, clinical medicine, and health sciences research who are also strong advocates for human rights. The speakers will stress the importance of addressing the underlying social, political, and economic factors influencing health. Speakers will give examples from their background and the motivations for their career choices and discuss the skills and strategies necessary to become effective advocates for health and human rights.

TRMD 6170 Immunology (3)
This course is designed for students of public health and the basic biomedical sciences who are interested in a current overview of immunology. This course is a comprehensive introduction to immunity and immunopathogenesis as it relates to health and disease. Following a thorough consideration of cells and tissues of the immune system, attention is given to immune recognition and regulation of immune responses, with special emphasis on the role of cytokines in immunity. Finally, clinical concepts are presented with current knowledge of basic immune mechanisms for each: autoimmunity and autoimmune disease, transplant rejection, immunity to tumors, primary immunodeficiency diseases, and immunity to infectious agents including viruses and parasites, and immunopathogenesis of HIV/AIDS.

TRMD 6200 Impact Evaluation in GH (3)
This course provides students with basic concepts, principles, and practices for the evaluation of public health programs and interventions. The course is intended to 1) introduce students to impact evaluation, 2) provide a solid grounding in study designs relevant in field settings; 3) develop students' skills in designing evaluation plans, and 4) serve as a foundation for more specialized program evaluation classes as well as for courses on data analysis, sampling, epidemiology, and operations research.

TRMD 6250 Biomedical Research Methods (3)
Students will be able to apply the basic biomedical methods used in public health and tropical medicine research or practice, and summarize the principle and the theoretical basis. They will be able to analyze the strengths and weaknesses of the different methods, and design hypothesis-driven studies to address public health and tropical medicine problems, applying the appropriate methods. Students will also assess scientific papers and critically appraise their relative merit in the field of public health research and practice.

TRMD 6330 Microbial Disease of Trp (2)
This course introduces students to the most important bacterial, viral, and mycotic pathogens in the tropics and to clinical features of the associated diseases. The course will focus on topics not ordinarily covered in depth in U.S. medical schools, such as cholera, tuberculosis, leprosy, arboviral infections, and hemorrhagic fevers, among others. The course will be team taught by both microbiologists and clinicians. Topics covered will include geographic distribution, transmission, and pathogenesis, clinical features of relevant diseases, immunologic considerations, laboratory diagnosis, treatment, and control.

TRMD 6340 Diagnostic Meth/Microbio (2)
This laboratory course parallels topics presented in TRMD 6330. The course is designed to teach students how to perform basic laboratory tests using simple techniques applicable to developing countries. Most of these will be diagnostic tests for infectious diseases, although some clinically relevant non-diagnostic techniques will also be taught (e.g., complete blood counts). The bulk of the course consists of hands-on laboratory experience conducting laboratory tests with clinical specimens and analyzing prepared teaching specimens. Procedures for organism isolation and identification and rapid diagnostic kits will be covered.

TRMD 6350 Disease Prev and Control (2)
This course is designed for students enrolled in the diploma in tropical medicine and traveler's health program to prepare them to recognize and contribute effectively to the public health needs of communities in developing countries. The course focuses on disease prevention and control strategies with special reference to developing countries; assessment of community needs, and provision of basic preventive services; control of important endemic diseases such as malaria, tuberculosis, and HIV/AIDS; and other topics such as outbreak investigation, emerging infectious diseases, immunization programs, and disease eradication programs.

TRMD 6420 Tropical Virology (3)
This course covers broad concepts of, and important interventions for, major viral diseases. The course places emphasis on viruses that are found in tropical countries and/or are considered recently emergent pathogens. Students enrolled in the course should come with a basic understanding of communicable disease concepts.
TRMD 6450  Tb Global Trends & Inter  (2)
Students, faculty and visiting professors will present clinical cases pertaining to issues in tropical medicine, wilderness medicine and travel medicine. There will be active class participation.

TRMD 7000  Tropical Medicine Semin  (1)
Tropical Medicine Seminar is designed as a journal club, with the specific goal of training students to develop skills in critically evaluating and effectively presenting relevant scientific literature. Each student is expected to present at least one article to the class from recent tropical medicine literature, and to attend and actively participate during presentation delivered by other students. Course may be repeated up to unlimited credit hours.

TRMD 7020  Infectious Disease Seminar  (1)
The seminar experience is intended to stimulate a critical reading of the current literature and to ensure that each student learns to present important and potentially controversial data in a rigorous and careful fashion.

TRMD 7180  Immunoparasitology  (2)
Prerequisite(s): TRMD 6170.

TRMD 7300  Mchnsms of Pthogen Intrventn  (2)
This course provides an advanced foundation of knowledge about the selection and mechanisms of action of different interventions against important viruses, bacteria and unicellular parasites of public health significance. The course describes how drugs, vaccines and other intervention agents reach their cellular targets and how they act in harmony with the host immune system to control or eradicate the pathogen, inside the human or the arthropod hosts. Prerequisite(s): TRMD 6170.

TRMD 7330  Advanced Topics in Host Pathog  (2)
Prerequisite(s): TRMD 6170, 6070 and 6330.

TRMD 7420  Pop Bsed Mlaria Prev and Ctrl  (3)
This course introduces the principles of prevention and control of malaria infection and disease, as well as population based methods for evaluating the success of control programs or new interventions. This course investigates how culture, society, and the environment influence disease transmission, risk factors, and health status. Students will analyze data and integrate information using a monitoring and evaluation framework to inform prevention and control policy. Topics covered will include vector ecology, malaria epidemiology, malaria control strategies, malaria monitoring and evaluation, issues around cost-effectiveness, and prospects for elimination. Prerequisite(s): (EPID 6030 or SPHL 6060).

TRMD 7440  Houshld Smplng Apps in Dvlping  (3)
The use of scientific household surveys to obtain population-level data for research and program-related needs in developing countries without adequate health information systems has become increasingly common in the international health, population and nutrition sectors. This is attested to by the proliferation of standardized survey protocols in these sectors. In order to take full advantage of recent developments in survey methodologies, professionals working in these sectors need to have a solid understanding of the intended uses and limitations of various standard sampling protocols, as well as the underlying principles of survey measurement. Prerequisite(s): (BIOS 6030* or SPHL 6050* and EPID 6030* or SPHL 6060*). * May be taken concurrently.

TRMD 7500  Advanced Tropical Virology  (2)
This course covers advanced topics in tropical virology. The focus is on viruses of recent public health concern in developing and tropical countries. Both historically problematic and emerging viruses are covered. Topics from published literature include molecular biology, epidemiology and pathology. Emphasis is placed on extending and deepening the understanding of the molecular aspects of the viral replication that gives rise to transmission and pathogenic characteristics. Additional topics include the interactions between the virus and host immune response, as well as viral control and the development of vaccines and anti-viral pharmaceuticals. Prerequisite(s): (TRMD 6420 or 6420).

Prerequisite(s): (TRMD 6420 or 6420).
TRMD 7800  Adv Medical Entomology  (2)
This is an advanced course that challenges students to consider basic principles in medical entomology relating to the ecology, epidemiology, and control of pathogen transmission. Lectures and corresponding laboratories cover topics such as vector behavior, physiology, genetics, immune response, molecular biology, vector-pathogen interaction and vector-borne disease surveillance and diagnostics. This material provides a foundation for understanding vector ecology and the dynamics of pathogen transmission. Students will learn how current research in medical entomology offers new prospects for the control of vector-borne diseases. They will also learn about and work through the process of grant preparation and submission to obtain funding for vector-borne disease research. Prerequisite(s): TRMD 6060.

Prerequisite(s): TRMD 6060.

TRMD 7820  Malaria  (2)
This is an advanced course which provides a rigorous approach to both the basic and applied issues related to malaria and malaria control. Areas covered in detail include cell biology and biochemistry of the parasite-red cell integration, antimalarial drug action and resistance mechanisms, parasite genetics and cell biology and the immunologic aspects of malaria, including asexual and sexual stage candidate vaccine antigens. At the conclusion of the semester, students are expected to critically review current malaria control and research strategies and to suggest and defend appropriate alternatives.

TRMD 7860  Clinical Case Presentations  (1)
Students, faculty and visiting professors will present clinical cases pertaining to issues in tropical medicine, wilderness medicine and travel medicine. There will be active class participation.

TRMD 7860  Clinical Case Presentations  (1)
Students, faculty and visiting professors will present clinical cases pertaining to issues in tropical medicine, wilderness medicine and travel medicine. There will be active class participation.

TRMD 7860  Clinical Case Presentations  (1)
Students, faculty and visiting professors will present clinical cases pertaining to issues in tropical medicine, wilderness medicine and travel medicine. There will be active class participation.

TRMD 7960  Clinical Tropical Medicine  (2)
Clinical Tropical Medicine is designed to offer an overview of topics of clinical importance in tropical medicine. In most cases, topics are presented in syndromic fashion. The course is expected to complement the other course offerings from the Tropical Medicine Department for the MPH/MT and Diploma curricula. Participants should have some experience in clinical medicine and should either have experience or be in the process of learning about diseases of the tropics.

TRMD 7990  Special Studies  (1-3)
Masters students and advisor select a topic for independent study and develop learning objectives and the expected written final product.

TRMD 8080  Advanced Methods in Molecular Epidemiology  (3)
TRMD 8080 and 8090 are interdependent courses designed to develop skills in generating hypotheses specific to DNA sequence data, applying protocols for sample collection, analysis of large data sets, use of the MiSeq instrument and presentation of research findings that demonstrate rigor and reproducibility. TRMD 8080 is taken in the fall semester and introduces students to the principles and theoretical bases of novel molecular methods, design studies and hypotheses to be addressed. Students learn to collect sequence data using an accessible sequencing instrument. The experience of these courses will be broadly applicable, regardless of the area of public health pursued.

TRMD 8090  Advanced Methods in Molecular Epidemiology  (3)
TRMD 8080 and 8090 are interdependent courses designed to develop skills in generating hypotheses specific to DNA sequence data, applying protocols for sample collection, analysis of large data sets, use of the MiniON instrument and presentation of research findings that demonstrate rigor and reproducibility. TRMD 8090, taken in the spring, equips students with techniques for evaluating and analyzing large data sets, with attention to rigor and reproducibility. The experience of these courses will be broadly applicable, regardless of the area of public health pursued.

TRMD 8100  Laboratory Rotation  (2)

TRMD 8990  Doctoral Independent Study  (1-3)
Doctoral students and advisor select a topic for independent study and develop learning objectives and the expected final written product.

TRMD 9970  Dissertation  (0)
Doctoral candidates who have defended their prospectus and are engaged in research. Course may be repeated up to unlimited credit hours.

TRMD 9980  Master's Thesis Research  (0)
MS students engaging in thesis research. Course may be repeated up to unlimited credit hours.

TRMD 9990  Dissertation Research  (2)
Doctoral students who have completed course work but not defended their prospectus. Course may be repeated up to unlimited credit hours.
